Which room is least likely to contain a pit?

Diagnosis

- Reasoning from symptoms to causes
 - What disease is most likely to be causing the observed symptoms

Diagnosis

- Reasoning from symptoms to causes
 - What disease is most likely to be causing the observed symptoms

Diagnostic rule: *Toothache* \Rightarrow *Cavity*

Diagnosis

- Reasoning from symptoms to causes
 - What disease is most likely to be causing the observed symptoms

~~Diagnostic rule: *Toothache* \Rightarrow *Cavity*~~

Toothache \Rightarrow *Cavity* \vee *GumProblem* \vee *Abcess* \vee ...

Diagnosis

- Reasoning from symptoms to causes
 - What disease is most likely to be causing the observed symptoms

~~Diagnostic rule: $\textit{Toothache} \Rightarrow \textit{Cavity}$~~

$\textit{Toothache} \Rightarrow \textit{Cavity} \vee \textit{GumProblem} \vee \textit{Abcess} \vee \dots$

Causal rule: $\textit{Cavity} \Rightarrow \textit{Toothache}$

Approach

- Representing uncertain information
- Reasoning with uncertain information
 - Uncertain inference

Hungry=true,
Cranky=true

Hungry=false,
Cranky=false

Possible Worlds

- Logical knowledge rules out possible worlds

Possible Worlds

- Logical knowledge rules out possible worlds
- Probabilistic assertions talk about how probable (likely) the possible worlds are

Heads or Tails

Red, Green, or Blue

Experiments

Outcomes

Heads or Tails

Red, Green, or Blue

Conceptualization
(Ontology)

Experiments

Outcomes

Heads or Tails

Red, Green, or Blue

Conceptualization
(Ontology)

Possible
World

Sample Space

- Set of all possible outcomes:

$$\Omega = \{ \omega_i \}$$

- Possible worlds ω_i are:
 - Mutually exclusive
 - Exhaustive

Sample Space

- Set of all possible outcomes:

$$\Omega = \{ \omega_i \}$$

- Possible worlds ω_i are:

- Mutually exclusive
- Exhaustive

Same as in logic

$$\Omega = \{ \omega_i \} = \{ (1,1), (1,2), (2,1), (3,1), \dots \}$$

Probability Model

- Assigns a numerical probability $P(\omega)$ to each outcome*, such that:

$$0 \leq P(\omega) \leq 1$$

$$\sum_{\omega \in \Omega} P(\omega) = 1$$

*Finite, countable set

Where Do Probabilities
Come From?

Degrees of Belief

- The degree to which an agent believes a possible world is the actual world
 - 0: certainly not the case (i.e., false)
 - 1: certainly is the case (i.e., true)

Degrees of Belief

- The degree to which an agent believes a possible world is the actual world
 - 0: certainly not the case (i.e., false)
 - 1: certainly is the case (i.e., true)
- Could come from statistical data, general principles, combination of evidence, ...

Probability Model

- Assigns a degree of belief $P(\omega)$ to each possible world, such that:

$$0 \leq P(\omega) \leq 1$$

$$\sum_{\omega \in \Omega} P(\omega) = 1$$

$$P(\omega_i) = 1/36 \text{ for all } \omega_i \in \Omega$$

$$P(\omega_i) = 2/36 \text{ if } \omega_i \in \{[1,1], [2,2], [3,3], [4,4], [5,5], [6,6]\}$$

$$P(\omega_i) = 2/90 \text{ otherwise}$$

Events

- An event is a subset of the sample space (that is, a set of outcomes a.k.a. possible worlds)
 - “Coming up heads”
 - “Throwing doubles”
 - “Picking one red and one green ball”

Events

- An event is a subset of the sample space (that is, a set of outcomes a.k.a. possible worlds)

$$P(e) = \sum_{\omega \in e} P(\omega)$$

$$P(\text{Total}=11) = P([5,6]) + P([6,5]) = 1/36 + 1/36 = 1/18$$

$$P(\text{Doubles}) = 1/6$$

$$P([1,1]) + P([2,2]) + P([3,3]) + P([4,4]) + P([5,5]) + P([6,6]) = 1/6$$

$$P(\text{Doubles}) = 1/4$$

$$P([1,1]) + P([2,2]) + P([3,3]) + P([4,4]) + P([5,5]) + P([6,6]) = 1/4$$

Probability

- Sample space: possible worlds
- Probability model: degrees of belief in possible worlds
- Events: subsets of possible worlds

Probability Statements

- “Heads and tails are equally likely”
- “Doubles are more likely than non-doubles”
- “The probability of picking one red and one green ball is 30% (0.3)”

Random Variable

- A function from outcomes to values
 - “the number of heads in three flips”
 - “the total of the two dice”
 - “the dice are matched doubles”
 - “a red ball was picked”

Factored Representation

- Represents a state (outcome, possible world) as a set of variable/value pairs
- Each random variable represents a feature or aspect of the world that we care about

Random Variable

“the number of heads in three flips”

$$X(HHH) = 3,$$

$$X(HHT) = X(HTH) = X(THH) = 2,$$

$$X(HTT) = X(THT) = X(TTH) = 1,$$

$$X(TTT) = 0$$

Random Variable

“the total of the two dice”

$$X([1,1]) = 2,$$

$$X([1,2]) = X([2,1]) = 3,$$

$$X([1,3]) = X([2,2]) = X([3,1]) = 4,$$

...

$$X([6,6]) = 12$$

Random Variable

“the dice are matched doubles”

$$X([1,1]) = X([2,2]) = X([3,3]) =$$

$$X([4,4]) = X([5,5]) = X([6,6]) = \textit{true},$$

$$X([1,2]) = X([1,3]) = X([1,4]) = \dots$$

$$\dots X([6,3]) = X([6,4]) = X([6,5]) = \textit{false}$$

Domain (of Random Variable)

- Finite
 - Set of values
 - Two values: Boolean
- Infinite
 - Discrete (e.g. integers)
 - Continuous (e.g. reals)
- May be ordered (or not)

Domain (of Random Variable)

★ Finite

- Set of values
 - Two values: Boolean
- Infinite
 - Discrete (e.g. integers)
 - Continuous (e.g. reals)
- May be ordered (or not)

Domain (of Random Variable)

$$Die_1 = \{ 1, \dots, 6 \}$$

$$Total = \{ 2, \dots, 12 \}$$

$$Doubles = \{ true, false \}$$

$$Weather = \{ sunny, rain, cloudy, snow \}$$

Statements

- Elementary (atomic) statement: $RV = value$

$$Die_1 = 3$$

$$Total = 7$$

$$Doubles = true \longrightarrow doubles$$

$$Weather = sunny \longrightarrow sunny$$

Statements

- Elementary (atomic) statement: $RV = value$

$$Die_1 = 3$$

$$Total = 7$$

$$Doubles = true \longrightarrow doubles$$

$$Weather = sunny \longrightarrow sunny$$

- Ordered domains: $<, >, \leq, \geq$

Statements

- Elementary (atomic) statement: $RV = value$

$$Die_1 = 3$$

$$Total = 7$$

$$Doubles = true \longrightarrow doubles$$

$$Weather = sunny \longrightarrow sunny$$

- Ordered domains: $<, >, \leq, \geq$

Can be true or false

Statements

- Elementary (atomic) statement: $RV = value$
- Combine with connectives from PL

$$Die_1 = 3 \wedge Total = 7$$

$$Total = 7 \vee doubles$$

$$Die_1 = 3 \wedge \neg doubles$$

Probability Statements

- Assign a probability to a statement

$$P(Die_1 = 3 \wedge Total = 7) = 1/36$$

$$P(Total = 7 \vee doubles) = 12/36$$

$$P(Die_1 = 3 \wedge \neg doubles) = 5/36$$

Probability Language

- Elementary (atomic) statement: $RV = value$
- Combine with connectives from PL
- Assign probabilities that statements are true: $P(statement) = p$

Probability Distribution

- Assign a probability to every possible value of a random variable

Weather: { sunny, rain, cloudy, snow }

$$P(\textit{Weather}=\textit{sunny}) = P(\textit{sunny}) = 0.6$$

$$P(\textit{Weather}=\textit{rain}) = P(\textit{rain}) = 0.1$$

$$P(\textit{Weather}=\textit{cloudy}) = P(\textit{cloudy}) = 0.29$$

$$P(\textit{Weather}=\textit{snow}) = P(\textit{snow}) = 0.01$$

Probability Distribution

- Assign a probability to every possible value of a random variable

Weather: { sunny, rain, cloudy, snow }

$$P(\textit{Weather}=\textit{sunny}) = P(\textit{sunny}) = 0.6$$

$$P(\textit{Weather}=\textit{rain}) = P(\textit{rain}) = 0.1$$

$$P(\textit{Weather}=\textit{cloudy}) = P(\textit{cloudy}) = 0.29$$

$$P(\textit{Weather}=\textit{snow}) = P(\textit{snow}) = 0.01$$

$$\mathbf{P}(\textit{Weather}) = \langle 0.6, 0.1, 0.29, 0.01 \rangle$$

Bold

Vector

Probability Distribution

- Assign a probability to every possible value of a random variable

Weather: { sunny, rain, cloudy, snow }

$$P(\textit{Weather}=\textit{sunny}) = P(\textit{sunny}) = 0.6$$

$$P(\textit{Weather}=\textit{rain}) = P(\textit{rain}) = 0.1$$

$$P(\textit{Weather}=\textit{cloudy}) = P(\textit{cloudy}) = 0.29$$

$$P(\textit{Weather}=\textit{snow}) = P(\textit{snow}) = 0.01$$

$$\mathbf{P}(\textit{Weather}) = \langle 0.6, 0.1, 0.29, 0.01 \rangle$$

Probabilities of a distribution must sum to 1

Probability Statements

- Random variables
- Domains
- Probability statements
 - Elementary (atomic) and compound
- Probability distribution
 - $P(\textit{Weather}) = \langle 0.6, 0.1, 0.29, 0.01 \rangle$

Multiple Variables

Weather

Cavity

Joint Distribution

- Distribution over multiple variables
- Gives probabilities of all combinations of the values of the variables

Joint Distributions

$P(\textit{Weather}, \textit{Cavity})$

		<i>Cavity</i>	
		<i>true</i>	<i>false</i>
<i>Weather</i>	<i>sunny</i>		
	<i>rain</i>		
	<i>cloudy</i>		
	<i>snow</i>		

Joint Distributions

$P(\textit{sunny}, \textit{Cavity})$

		<i>Cavity</i>	
		<i>true</i>	<i>false</i>
<i>Weather</i>	<i>sunny</i>		

Joint Distributions

$\mathbf{P}(sunny, cavity)$

		<i>Cavity</i>
		<i>true</i>
<i>Weather</i>	<i>sunny</i>	

$$\mathbf{P}(sunny, cavity) = P(sunny, cavity) = \mathbf{P}(sunny \wedge cavity)$$

Joint Distributions

- Distributions over multiple variables
- Describe probabilities of all combinations of the values of the variables

Full Joint Probability Distribution

- Joint probability distribution over all the random variables
- Probabilities for every possible combination of values assigned to random variables
- Probabilities for every possible world

Full Joint Probability Distribution

$P(\textit{Cavity}, \textit{Toothache}, \textit{Weather})$

	<i>toothache</i>		\neg <i>toothache</i>	
	<i>cavity</i>	\neg <i>cavity</i>	<i>cavity</i>	\neg <i>cavity</i>
<i>sunny</i>				
<i>rain</i>				
<i>cloudy</i>				
<i>snow</i>				

Representing Uncertainty

- Probability: Sample space, probabilities, events
- Random variables, domains
- Language of probability statements
- Probability distributions, joint distributions, full joint distribution
